A smartphone app selecting locations for city cleaners

Group member: Jingning Zhang, Zebin Wang, Jiyang Wen, Erjia Cui

Background of app design

- Serious situation for the government fighting against littering
- Limited number of cleaners working for the city
- Eager to find elaborated methods to increase cleaner's efficiency
- Citizens' awareness of keeping the city clean
- 311 Calls for littering: a good resource for data analysis

<u>Plot Link:</u> <u>https://publicworks.baltimorecity.gov/solid-waste</u>

Data source of our app

Data implemented in the app so far:

- 1. Daily 311 call data of Baltimore City for littering available online
- 2. Google Map API used to determine the location of reported litters

	SRRecordID	ServiceRequestNum	SRType	MethodReceived	CreatedDate	SRStatus	StatusDate

Tidy data

- Select rows related to street cleanliness
- Pick up columns "SRRecordID", "StatusDate", "GeoLocation"
- Obtain the distance between each pair using Google Map API

Input, Output & Flow of experience

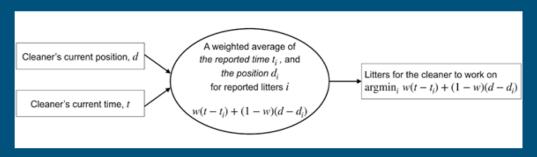

Data input:

- User's current location
- User's current time

Output of our app:

- Current location (green triangle)
- Recommended next work location (red star)
- All other work location (yellow dot)

Flow of Experience:

Ways to collect/present data

- Collect 311 call data from the local government database every day
- Set up Google Map API for obtaining location information or enabling navigation for cleaners
- Use Greedy Algorithm to search for a reported litter on file balancing urgency (t) and distance (d)
- Navigate the cleaner to the reported litter location via Google Map API data

Our Goal: Reduce 311 calls of littering in Baltimore City by 5% each year in the next 5 years

Target audience: city cleaners

Use case

A Shiny App: https://erjiacui.shinyapps.io/data_sprint/

- Suppose cleaner starts his/her work at JHSPH
- Every time one work is finished, update current location and current time to get next recommended work location
- May have new littering sites as time goes by

Discussion: How the app may fail

- The internet may fail in some locations at the city (metro stations, etc.)
- Cleaners may not have their smartphones available all the time at work

Annual budget

Fixed cost

- Server: \$1000/yr
- Maintenance: \$500/yr
- Location: \$2400/yr
- Technician salary: \$1000/mo * 12 mo = \$12000/yr
- Number of technician: 2

Variable cost

- Google Dynamic Maps price per thousand inquiries: \$5.6
- Estimated volume of inquiries : 300,000

Total cost: \$29580/yr

Thank You!
